### Abstract of **DE19724462**

In a composting process, the novelty is that material composted in a previous stage is then is inverted (5), moistened (6) and further composted under forced ventilation. Preferably before the further composting, the compost is held in intermediate storage (4) preferably in large heaps (2) and especially under a foil cover (3). Following the second composting, the composted material may used immediately for the end-purpose or is stored in a thin layer. Also claimed is a suitable apparatus for performing the process.
